ENCRYPTIC

An Open Source Hardware Encryption Engine

Sovereignty

Archives must remain under the control of their stewards over time. Many modern archival systems depend on vendors, platforms, or institutions to remain accessible.

Security

By minimizing dependencies and keeping protection mechanisms transparent and auditable, archives can remain both secure and trustworthy over decades.

Survivability

Archives must outlive tools, platforms, and organizations. Long-term preservation fails when access depends on continued software support;

Preservation is not enough.

PRESERVE TODAY FOR TOMORROW: WHY ARCHIVES MATTER

<https://app.encryptic.xyz>

Secure Archives are Useable Archives

■ ENCRYPTIC

Encryptic is a dedicated hardware encryption engine designed to make strong cryptography sovereign, secure, and accessible to everyone.

Using AES encryption, SHA256, and a user-supplied password, Encryptic securely encrypts and decrypts personal files with a single click.

Our mission is to make secure, dependency-free archiving accessible to everyone – so anyone can preserve their data without trusting third parties or complex systems they can't control.

Encryptic

ENCRYPTIC: A HARDWARE ENCRYPTION ENGINE

The Artix-7 speed is 1% of your standard modern-day CPU

Unlike traditional software tools, Encryptic runs on dedicated hardware, keeping sensitive data out of system memory and off servers entirely. The entire system is fully open source, auditable end-to-end, and designed to run locally or scale from FPGA to ASIC, making it both accessible to individuals and viable for long-term archival security.

<https://app.encryptic.xyz>

- **Fully Closed Loop**

The user has control over every single node in the system. At no point is your data shared or saved to any server.

- **Hardware Accelerated**

Offloads the easily parallelizable tasks involved in encryption and decryption to our own dedicated parallel processor.

- **Reproducible by Anyone**

Hardware is fully open-sourced. Anyone with any FPGA can run their own local encryption engine.

ENCRYPTION BUILT FOR ARCHIVES

Open Source Implementation

No Online Dependency

User Controlled Keys

Independence & Sovereignty
